# Stroke Disease Analysis KPI

AIM:
This dataset is used to predict whether a patient is likely to get stroke based on factors like gender, age, various diseases, and smoking status. Each row in the data provides relevant information about the patient.

5110
TOTAL DATA COLLECTED

correlation between average _glucose_level , age of a patient and their stroke status

stroke ● 1

correlation between age , gender and a patient stroke status

stroke ● 0 ● 1
